

WIDE ANGLE ARROWHEAD

ABSTRACT OF THE DISCLOSURE

5 A wide angle arrowhead which is light weight, and which
has minimal structure and surface area to decreased arrowhead
weight, surface area and drag to increase performance of an
arrow to which it is attached. A blade cutting edge of the
wide angle arrowhead maintains an interior angle relationship
to the centerline of an arrow shaft where such relationship
can be fashioned to have one interior angular relationship
10 within a specified angular range. Also, drag is minimized by
the utilization of a thin ground blade cutting edge, an
additional benefit of which is the decreasing of the cutting
edge bluntness, thereby enhancing easy target penetration.
